DETAILED ACTION

Allowable Subject Matter

1. The claimed limitations "the seismic data being acquired by an omnitilt sensor having at least three geophone components with an angular orientation $\phi\psi$, wherein estimators are determined which are combinations of these components, wherein various data are isolated, through the estimators, depending on whether they correspond to propagation with reflection or with conversion" are neither anticipated nor found obvious over the art of record. The closest related prior art, Gaiser (6205403), teaches operators to be applied to the various components of the sensor are determined for determining sensor reconstruction, the operators being those that minimize a deviation between reference data and data obtained by applying the estimators to the sensor reconstruction, the operators thus determined being applied to the data acquired, said operators used to reconstruct the orientation of at least one geophone of the omnitilt sensor along at least one of desired axis. However it does not teach the seismic data being acquired by an omnitilt sensor having at least three geophone components with an angular orientation $\phi\psi$, wherein estimators are determined which are combinations of these components, wherein various data are isolated, through the estimators, depending on whether they correspond to propagation with reflection or with conversion.
